Phosphorous Conversions for Soil Tests

Generally Accepted Agricultural And Management Practices for Manure Management and Utilization (GAAMPS or Right to Farm Guidelines). Current as of December 2001. If soil tests fall within the following levels, these guidelines should be followed:

If soil test is under 150 lbs. per acre Bray P₄:
It is acceptable to spread manure on this field as long as the nitrogen recommendation for the crop is not exceeded with the plant available nitrogen in the manure.

If the soil test is 150 to 300 lbs. per acre Bray P₄:
Manure should be spread at crop removal rates for phosphorus (P).
Up to four years of crop removal P can be applied via manure as long as the nitrogen needs of the crop are not exceeded and that manure is not applied again for the 4 year period. Example: Three years of manure phosphorus can be applied in one season and no more manure for three years.

If the soil test is 300 lbs. per acre or greater Bray P₄:
No manure should be applied until the soil test falls below 300 lbs. per acre to be in compliance with Right to Farm.

The above phosphorus levels are pounds of P as tested by the Bray P₄. To convert other soil test values to the equivalent unit, use the appropriate conversion:

If a soil test lists the P as ppm:
ppm X 2 = lbs. per acre P

If a soil test lists the P as lbs. per acre P₂O₅:
lbs per acre P as P₂O₅ ÷ 2.3 = lbs. per acre P

If a soil test is Mehlich x 0.9 = P₂O₅

Conversions for interpreting manure tests

Right to Farm GAAMPS refer to nutrients as P₂O₅ and K₂O. If the manure test reports nutrients as pounds per ton (solid manure) use the left hand column. If the manure test reports nutrients as pounds per 1000 gallons (liquid manure) use the right hand column.

Conversion Factors

<table>
<thead>
<tr>
<th>Solid Manure (lbs./Ton)</th>
<th>Liquid Manure (lbs./1,000 gal)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ppm P x 0.002 x 2.3 = lbs. P₂O₅ per ton</td>
<td>ppm P x 0.00835 x 2.3 = lbs. P₂O₅ per 1000 gal.</td>
</tr>
<tr>
<td>ppm K x 0.002 x 1.2 = lbs. K₂O per ton</td>
<td>ppm K x 0.00835 x 1.2 = lbs. K₂O per 1000 gal.</td>
</tr>
<tr>
<td>percent P x 20 x 2.3 = lbs. P₂O₅ per ton</td>
<td>percent P x 83.5 x 2.3 = lbs. P₂O₅ per 1000 gal.</td>
</tr>
<tr>
<td>percent K x 20 x 1.2 = lbs. K₂O per ton</td>
<td>percent K x 83.5 x 1.2 = lbs. K₂O per 1000 gal.</td>
</tr>
</tbody>
</table>
